Evaluation of the Antioxidant and antimicrobial Properties of Dorema aucheri plant

**Dear Editor,**

Seven species have been reported in the genus Dorema, family Umbelliferae, in the flora of Iran, among which two are endemic: D. aucheri Boiss. and D. ammoniacum D. Don. In Iranian traditional medicine, Dorema aucheri has been employed as stimulant, nervonic, antispasmodic, bronchodilator, expectorant, kidney stone repellent, emmenagogue and analgesic for visceral pain. This plant eaten as a green by some people in west part of Iran. D. aucheri in microliter scale to mice caused getting cancer dramatically. There are several reports on chemical composition, antihyperlipidemic and antihypercholesterolic effects of this plant. previous phytochemical investigations on this species revealed the presence of exudates flavonoides. Although thorough phytochemical and some evidence-based pharmacological studies have been carried out on the trunk and resin of D. aucheri, little is known about the antibacterial and antioxidant effects of ethanol extract of D. aucheri. The purpose of the present study was to elucidate these effects in vitro.

For this purpose Dorema aucheri Boiss. was collected from Oramanat area at Kermanshah province, west Iran (34°18′N, 47°3′E and 1420 m above sea level) in May 2010 and identified in Kermanshah Research Institute of Forests and Rangelands. ethanolic extract and essential oil of D. aucheri were prepared by us. Essential oil components were investigated by Gc/Mass. Total phenolic compounds in extracts were spectrophotometrically using the Folin–Ciocalteu reagent. We use DPPH and FTC method for determination of total phenolic content in the ethanol extracts of D. aucheri. The content of phenolic compounds was 38.42 mg.

Table 1: Main Components of Dorema aucheri essential oil identified by Gc and GC/MS

thirty six compounds were identified in the leaf oil of the plant, representing about 99.86% of the total oil with Curzerene (18.7%), Spathulenol (6.68%) and Isohibaene (6.16%) and Gembrene (6.66%) as the major constituents. (table 1) extract exhibited a notable dose dependent inhibition of the DPPH activity, with a 50% inhibition (IC₅₀) at a concentration of 0.2 mg/ml. we use Folin – ciocalteu method for determination of total phenolic content in the ethanol extracts of D. aucheri. The content of phenolic compounds was 38.42 mg.
Fig.1: Results showed this plant could be candidates for some of its biological activities and therefore for its therapeutic use
Plant extracts and plant-derived antioxidant compounds potentiate body’s antioxidant defense, they are antioxidants of choice because of their lower toxicity and side effects over the synthetic ones. Also, they are relatively cheaper and are easily accessible. The extract of D. aucheri has shown to possess in vitro antioxidant and antibacterial activities. The reducing ability of a compound generally depends on the presence of reductions, which exhibit antioxidant activity by breaking the free radical chain though donation of a hydrogen atom. Further studies need for the isolation and characterization of the active principles component for these activities in this plant.

Acknowledgment

This work is done with a financial support of Deputy of Research and Technology of ACECR, (project NO: 1301-11) and the authors are grateful for their collaboration.
